Product Description

BPX9010 highlights

- Simplicity, durability and versatility
- An all-around processor ready to perform a variety of applications
- Waste less, process more

No one likes spending their time cleaning netwrap and twine off the rotor. That's why the rotor cleaner attachment is designed to reduce excessive net and twine on the rotor and to minimize the amount that ends up in the feed.

Load bales conveniently and reduce machine stress with the vertical bale lift system. The robust T-style tongue frame, free of welds at high-stress points, adds durability by being bolted high on the tub.

Feed the bale consistently into the rotor with the slat and chain bale rotation design - reducing the need for reverse rotation.

Consistent feeding comes standard, thanks to an offset rotor that pulls the material through the machine and helps prevent uncontrolled fall-through when slowing down.

Gain control during operation with the toolless cut control bar design, featuring ten settings to customize your processing speed and material size.

Process both round and large square bales evenly and consistently with the optional powered sidewall kit and the optional straight fork kit.

Spread bedding with consistency at ranges of up to 50 ft (15.2 m).
