Product Description

VT1150 Premium highlights

- Heavy-duty planetary and larger size for maximum load capacity
- Standard planetary cooling system and optional two-speed gearbox cooling
- Optimize ration costs and help reduce feed waste

Optional bidirectional discharge makes feeding convenient. Feed either on the right or left side of the alley when traveling between pens or multiple buildings. Optimize rations and achieve defined targets when feeding in multiple pens with a 4-point scale. Plus, wireless connectivity makes load weights accessible from a smart device. Three points of contact with the tub floor, made up of two bi-pulse legs and the leading edge of the screw, help move material from the tub to the discharge conveyor for consistent distribution along a bunk line or tire. Achieve a consistent, thorough mix with two overlapping screws and offset baffles on the tub wall. Instead of feedstuffs remaining in either the front or the back of the tub, the tub construction encourages the material to travel between the screws. Optional bidirectional discharge makes feeding convenient. Feed either on the right or left side of the alley when traveling between pens or multiple buildings.
