Product Description

VT660 highlights

- High-screw rpm and low loading height make this a popular model with mid-sized feedlots
- Quick, efficient cleanout helps save time and frustration
- Optimize ration costs and help reduce feed waste

Relieve horsepower demand while mixing heavy rations with the standard 2-speed gearbox. Use the low speed (26 rpm) at the start of the mix and use the high speed (39 rpm) for more complete cleanout. At just 105 in (267 cm), the low loading height provides versatility among different operations during loading, feeding and storage in situations where clearance restrictions may be present. Optimize mixing speed and achieve a thorough cleanout with high-screw rpm. Three points of contact with the tub floor, made up of two bi-pulse legs and the leading edge of the screw help move material from the tub to the discharge conveyor for consistent distribution along a bunk line or tire. At just 105 in (267 cm), the low loading height provides versatility among different operations during loading, feeding and storage in situations where clearance restrictions may be present.
