Product Description

VR1428 highlights

- Just what operators need at the height of hay season
- Designed for high-capacity, speed and maximized productivity
- Wide raking width, yet nimble enough to maneuver like a smaller machine

When in raking position, the rear wheels are positioned close to the tractor — resulting in ease of maneuverability for such a large machine.

Operators can engage and disengage the transport lock without leaving the tractor with automatic field transport locks.

Consistent dry down — even in the center swath — can be achieved with the optional center splitter's dual-angled, ground driven rake wheels. This feature splits the crop to allow for more air flow in the windrow.

Minimize weight changes through wheel float range and minimize wear and tear on rake wheel teeth and the amount of dirt and rocks in operator's hay.
