Product Description

VR1224 highlights

- Rake field after field with ease
- High-performance and reliability
- Simple features make operation a breeze

Consistent dry down — even in the center swath — can be achieved with the optional center splitter's dual-angled, ground driven rake wheels. This feature splits the crop to allow for more air flow in the windrow.

Create clean, defined windrows and minimize wear on rake tines with a rubber torsion toolbar suspension that lets operators adjust rake wheel down pressure to match crop volume and conditions.

Help keep your equipment running smoothly with greaseable tapered roller bearings on both the rake and transport wheels for reduced friction and longer lifespan.

Enable single-side raking in seconds without any tools by selecting either left- or right-side raking configurations.

Easily adjust raking width and angle without tools, allowing you to quickly increase or decrease windrow size for optimal efficiency.
