Product Description

R2300 highlights

- Good bale shape starts with the windrow
- Built to last with heavy-duty components
- Adjust the width of the windrows to match your baler

Help keep your hay clean and free from contaminants with hydraulically driven baskets featuring rubber-mounted rake teeth that engage the crop, not the ground.

Rugged, reinforced frames with round cross-section toolbars and grease-free windrow-width slide adjustments optimize production in the field and make maintenance efficient.

Optimize your raking efficiency with optional basket speed control, allowing you to match the raking action to crop and field conditions without the need to adjust speed.

Transportation is fast and convenient. Hydraulic control from the cab allows operators to navigate narrow gate openings and country roads with a transport width of 8.4 ft (2.6 m).

Improve moisture control and consistency throughout the windrow with optional powered splitters that spread hay in the center of the swath, combining it with the rest of the crop.
