Product Description

ZR5-1200 highlights

- Get ready to let the ZR5-1200 self-propelled baler change the way you put up hay
- Make quick work of a field with an unprecedented level of comfort and maneuverability
- Reduce the number of steps needed to make a bale with automation

Minimize missed windrows to help maximize productivity. The zero-turn capabilities of the ZR5-1200 means you can spend less time correcting course and more time baling when compared to a conventional tractor-baler combination.

Experience a smooth, comfortable ride with the cab uniquely positioned over the suspension. A patented independent suspension system within the ZR5-1200 allows operators to better handle the uneven ground conditions that naturally come with baling.

Experience speeds of up to 12 mph (19.3 km/hr) in the field based on ground conditions, and up to 34 mph (54 km/hr) when in transport mode.
